

## Hubbard County: Final Overview of Nitrate Levels in Private Wells (2016-2017)

The Minnesota Department of Agriculture (MDA) determines current nitrate-nitrogen concentrations in private wells, on a township scale, through the Township Testing Program. The MDA has identified townships throughout the state that are vulnerable to groundwater contamination and have significant row crop production. The MDA plans to offer nitrate testing to more than 70,000 private well owners in over 300 townships by 2019.

Each selected township is offered testing in two steps, the “initial” sampling and the “follow-up” sampling. In the initial sampling, all township homeowners using private wells are sent a nitrate test kit. If nitrate is detected in their initial sample, the homeowner is offered a follow-up nitrate test, pesticide test and well site visit. Trained MDA staff visit willing homeowners to resample the well and then conduct a site assessment. The assessment helps to identify possible non-fertilizer sources of nitrate and to see the condition of the well. A well with construction problems may be more susceptible to contamination.

The MDA and Hubbard County Soil and Water Conservation District worked together to select townships and implement the nitrate testing project. The following townships were selected: **Badoura, Crow Wing Lake, Henrietta, Hubbard, Straight River, and Todd**. The initial sampling in Hubbard County started in 2016 and follow-up sampling ended in 2017.

### Results

Two datasets are used to evaluate nitrate. The initial well dataset contains 1,106 wells; the final dataset contains 1,048 wells. Wells that had nitrate-nitrogen results over 5 mg/L were removed from the initial dataset if a non-fertilizer source or well problem was identified, to form the final well dataset. A total of 58 wells (5%) were removed. The results from the initial and final well datasets are summarized in the table below.

In Badoura and Hubbard Townships, more than 10% of the wells were over the Health Risk Limit of 10 mg/L of nitrate-nitrogen (map below). The percent of wells over the Health Risk Limit in each township ranged from 2.4% to 15.2%. The Hubbard County Final Report will be available on the MDA website in 2018:

[www.mda.state.mn.us/townshiptesting](http://www.mda.state.mn.us/townshiptesting).

### Next steps

The MDA uses the final well dataset to determine if additional action is warranted, as described in the Minnesota Nitrogen Fertilizer Management Plan (NFMP). The MDA uses the assessment process and prioritization guidelines in the NFMP to determine next steps. Find more information about the NFMP on the MDA website at [www.mda.state.mn.us/nfmp](http://www.mda.state.mn.us/nfmp).

Table: Hubbard County Private Well Nitrate Results, 2018.

Township	Initial Well Dataset		Final Well Dataset	
	Total Wells*	Percent of Wells $\geq 10$ mg/L Nitrate-Nitrogen	Total Wells	Percent of Wells $\geq 10$ mg/L Nitrate-Nitrogen
Badoura	41	17.1%	38	13.2%
Crow Wing	208	8.7%	202	7.4%
Henrietta	259	3.5%	254	2.4%
Hubbard	241	19.5%	223	15.2%
Straight River	137	10.2%	128	7.0%
Todd	220	9.5%	203	5.4%
Total	1,106	10.5%	1,048	7.6%

\* All well types included.
